

Docket No. 8022-1080
Appln. No. 10/516,821

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

1. (previously presented) A thermo-optic phase shifter comprising:

a substrate;

a heater;

a clad layer provided directly or indirectly on said substrate;

a bridge section clad layer formed apart from said substrate and said clad layer in a portion corresponding to said heater; and

a core layer provided inside said bridge section clad layer,

wherein said bridge section clad layer and said core layer form a bridge section optical waveguide in said heater corresponding portion, and

said heater is provided inside or outside said bridge section optical waveguide apart from said core layer in said heater corresponding portion, and generates heat to change a phase of a light signal propagated in said bridge section optical waveguide,

said clad layer is formed on said substrate through a sacrifice layer,

 said sacrifice layer is formed of material with an etching rate larger than that of said substrate, and

 said sacrifice layer is formed of the material with a thermal conductivity smaller than that of said substrate,

 wherein said sacrifice layer is formed of glass doped with phosphorus, and said clad layer is formed of glass doped with boron and phosphorus.

2. (canceled)

3. (previously presented) The thermo-optic phase shifter according to claim 1, wherein said core layer, said clad layer and said bridge section clad layer are formed of glass material containing quartz.

4. (previously presented) The thermo-optic phase shifter according to claim 1, wherein said glass material of said core layer contains germanium.

5. (previously presented) The thermo-optic phase shifter according to claim 1, wherein said substrate is formed of glass material containing quartz or silicon.

6-9. (canceled)

10. (previously presented) The thermo-optic phase shifter according to claim 1, wherein said heater is provided on said bridge section clad layer.

11. (previously presented) The thermo-optic phase shifter according to claim 1, wherein said heater is provided in said bridge section clad layer apart from said core layer.

12. (original) The thermo-optic phase shifter according to claim 11, wherein said heater is provided under said core layer in said bridge section clad layer.

13. (previously presented) A thermo-optic phase shifter comprising:

a substrate;

a heater;

a clad layer provided directly or indirectly on said substrate;

a bridge section clad layer formed apart from said substrate and said clad layer in a portion corresponding to said heater, said bridge section clad layer being connected with said clad layer in a portion of said phase shifter other than said heater corresponding portion;

a core layer provided inside said bridge section clad layer;

wherein said bridge section clad layer and said core layer form a bridge section optical waveguide in said heater corresponding portion;

said heater is provided inside or outside said bridge section optical waveguide apart from said core layer in said heater corresponding portion, and generates heat to change a

phase of a light signal propagated in said bridge section optical waveguide; and

a supporting section provided in a part of a space between said bridge section optical waveguide and said substrate in an extending direction of said core layer to support said bridge section clad layer.

14. (original) The thermo-optic phase shifter according to claim 13, wherein a width of a portion of said bridge section optical waveguide where said supporting section is provided is wider than that of a portion of said bridge section optical waveguide where said supporting section is not provided.

15. (previously presented) The thermo-optic phase shifter according to claim 13, wherein said supporting section is formed of material with a thermal conductivity smaller than that of said substrate.

16. (previously presented) A thermo-optic phase shifter comprising:

a substrate;

a heater;

a clad layer provided directly or indirectly on said substrate;

a bridge section clad layer formed apart from said substrate and said clad layer in a portion corresponding to said heater, said bridge section clad layer being connected with said

clad layer in a portion of said phase shifter other than said heater corresponding portion;

a core layer provided inside said bridge section clad layer; and

a supporting section provided in a part of a space between said bridge section optical waveguide and said substrate to support said bridge section clad layer,

wherein said bridge section clad layer and said core layer form a bridge section optical waveguide in said heater corresponding portion,

said heater is provided inside or outside said bridge section optical waveguide apart from said core layer in said heater corresponding portion, and generates heat to change a phase of a light signal propagated in said bridge section optical waveguide; and

said supporting section is formed of material of an etching rate larger than that of said substrate.

17. (previously presented) The thermo-optic phase shifter according to claim 13, wherein said supporting section is formed of a same material as said clad layer.

18. (previously presented) The thermo-optic phase shifter according to claim 13, wherein said supporting section is continuously formed over a full length of said bridge section optical waveguide in a direction in which said core layer extends.

19. (previously presented) The thermo-optic phase shifter according to claim 13, wherein said supporting section is formed in the portion in a direction in which said core layer extends.

20. (previously presented) The thermo-optic phase shifter according to claim 13, wherein said optical waveguide clad layer has a width wider in ends of said heater corresponding portion than in a center of said heater corresponding portion.

21. (previously presented) The thermo-optic phase shifter according to claim 13, further comprising:

a reinforcing beam provided in grooves between said clad layer and said optical waveguide clad layer on a way of said heater corresponding portion to support said optical waveguide by connecting said clad layer and said optical waveguide clad layer.

22. (previously presented) A method of manufacturing a thermo-optic phase shifter, comprising:

forming a sacrifice layer on a substrate, said sacrifice layer having an etching rate larger than said substrate;

forming a lower clad layer to cover said sacrifice layer, said lower clad layer having an etching rate smaller than that of said sacrifice layer;

forming a core layer in a predetermined portion on said lower clad layer;

forming an upper clad layer on said lower clad layer and said core layer;

forming a heater in a portion corresponding to said predetermined portion on said upper clad layer;

forming grooves in a portion corresponding to said predetermined portion on both sides of said heater to pass through said upper clad layer and said lower clad layer to said sacrifice layer; and

removing at least a portion of said sacrifice layer through said grooves,

wherein said removing comprises:

removing said sacrifice layer to leave a portion for supporting said lower clad layer in a portion corresponding to said predetermined portion.

23. (previously presented) A method of manufacturing a thermo-optic phase shifter, comprising:

forming a sacrifice layer on a substrate, said sacrifice layer being formed of glass doped with phosphorus and having an etching rate larger than that of said substrate;

forming a first lower clad layer to cover said sacrifice layer, said first lower clad layer being formed of glass doped with boron and phosphorus and having an etching rate smaller than said sacrifice layer;

forming a heater in a predetermined portion on said first lower clad layer;

forming a second lower clad layer on said first lower clad layer, a lower clad layer having said lower first clad layer and said second lower clad layer;

forming a core layer in a portion corresponding to said predetermined portion on said second lower clad layer;

forming an upper clad layer on said lower clad layer and said core layer;

forming grooves on both sides of said heater in a portion corresponding to said predetermined portion to pass through said upper clad layer and said lower clad layer to said sacrifice layer; and

removing at least a portion of said sacrifice layer through said grooves.

24. (previously presented) The method of manufacturing a thermo-optic phase shifter according to claim 23, wherein said removing comprises:

removing said sacrifice layer to form a space between said lower clad layer and said substrate to connect said grooves with each other.

25-28. (canceled)

29. (previously presented) The method of manufacturing a thermo-optic phase shifter according to claim 22, wherein said forming an upper clad layer, said forming a core layer and said forming a lower clad layer are carried out by an atmosphere

chemical vapor deposition method or a plasma chemical vapor deposition method.

30. (previously presented) A thermo-optic phase shifter comprising:

a substrate;

a heater;

a clad layer provided directly or indirectly on said substrate;

a bridge section clad layer formed apart from said substrate and said clad layer in a portion corresponding to said heater, said bridge section clad layer being connected with said clad layer in a portion of said phase shifter other than said heater corresponding portion;

a core layer provided inside said bridge section clad layer; and

a supporting section provided in a portion of a space between said bridge section optical waveguide and said substrate in an extending direction of said core layer to support said bridge section clad layer,

wherein said bridge section clad layer and said core layer form a bridge section optical waveguide in said heater corresponding portion,

said heater is provided inside or outside said bridge section optical waveguide apart from said core layer in said heater corresponding portion, and generates heat to change a

phase of a light signal propagated in said bridge section optical waveguide; and

 said supporting section is formed of material with an etching rate larger than that of said substrate, and a thermal conductivity of said supporting section is smaller than that of said substrate.

31. (previously presented) A thermo-optic phase shifter comprising:

 a substrate;

 a heater;

 a clad layer provided on said substrate;

 a bridge section clad layer formed apart from said substrate and said clad layer in a portion corresponding to said heater; and

 a core layer provided inside said bridge section clad layer,

 wherein said bridge section clad layer and said core layer form a bridge section optical waveguide in said heater corresponding portion,

 said heater is provided inside or outside said bridge section optical waveguide apart from said core layer in said heater corresponding portion, and generates heat to change a phase of a light signal propagated in said bridge section optical waveguide,

said clad layer is formed on said substrate through a sacrifice layer,

said sacrifice layer is formed of material with an etching rate larger than that of said substrate,

said sacrifice layer is formed of the material with a thermal conductivity smaller than that of said substrate, and

said bridge section clad layer has a width wider in ends of said heater corresponding portion than in a center of said heater corresponding portion.

32. (previously presented) The thermo-optic phase shifter according to claim 1, further comprising:

a reinforcing beam provided in grooves between said clad layer and said optical waveguide clad layer on a way of said heater corresponding portion to support said optical waveguide by connecting said clad layer and said optical waveguide clad layer.

33. (previously presented) The thermo-optic phase shifter according to claim 16, wherein said supporting section is formed of a same material as said clad layer.

34. (previously presented) The thermo-optic phase shifter according to claim 16, wherein said supporting section is continuously formed over a full length of said bridge section optical waveguide in a direction in which said core layer extends.

35. (previously presented) The thermo-optic phase shifter according to claim 16, wherein said supporting section is

formed in the portion in a direction in which said core layer extends.

36. (previously presented) The thermo-optic phase shifter according to claim 30, wherein said supporting section is formed of a same material as said clad layer.

37. (previously presented) The thermo-optic phase shifter according to claim 30, wherein said supporting section is continuously formed over a full length of said bridge section optical waveguide in a direction in which said core layer extends.

38. (previously presented) The thermo-optic phase shifter according to claim 30, wherein said supporting section is formed in the portion in a direction in which said core layer extends.

39. (previously presented) The thermo-optic phase shifter according to claim 16, wherein said optical waveguide clad layer has a width wider in ends of said heater corresponding portion than in a center of said heater corresponding portion.

40. (previously presented) The thermo-optic phase shifter according to claim 16, further comprising:

a reinforcing beam provided in grooves between said clad layer and said optical waveguide clad layer on a way of said heater corresponding portion to support said optical waveguide by connecting said clad layer and said optical waveguide clad layer.

41. (previously presented) The thermo-optic phase shifter according to claim 30, wherein said optical waveguide clad layer has a width wider in ends of said heater corresponding portion than in a center of said heater corresponding portion.

42. (previously presented) The thermo-optic phase shifter according to claim 30, further comprising:

a reinforcing beam provided in grooves between said clad layer and said optical waveguide clad layer on a way of said heater corresponding portion to support said optical waveguide by connecting said clad layer and said optical waveguide clad layer.

43. (previously presented) The method of manufacturing a thermo-optic phase shifter according to claim 23, wherein said forming an upper clad layer, said forming a core layer and said forming a lower clad layer are carried out by an atmosphere chemical vapor deposition method or a plasma chemical vapor deposition method.

44. (canceled)

45. (new) The thermo-optic phase shifter of claim 13, wherein said supporting section extends less than a full length of said bridge section optical waveguide in a direction in which said core layer extends.
